Running Drop Market

A beginner-friendly setup guide — no programming experience required.

1 Download the tools you need (one-time setup)

- **Java Development Kit (JDK) 11** — required to build and run the project.
  Download: adoptium.net/temurin/releases/?version=11
  Pick the installer for your operating system (macOS, Windows, or Linux) and run it like any normal installer.
- **Git** — used to download ("clone") the project's code from GitHub.
  Download: git-scm.com/downloads
  Default install options are fine — just click Next/Continue through the installer.
- **A Jagex account** logged into the Jagex launcher — needed to actually log in and see the plugin running in-game.
  Download the launcher: account.jagex.com/en-GB/launcher

2 Download the project's code

- Open a terminal:
  - **MAC:** open the **Terminal** app (search for it with Spotlight, Cmd+Space)
  - **WINDOWS:** open **Git Bash** (installed with Git) or PowerShell
- Navigate to a folder where you want the project to live, for example:

```
cd Desktop
```

- Download the project (replace the URL with your actual GitHub repo URL):

```
git clone https://github.com/YOUR_USERNAME/drop-market.git
cd drop-market
```

3 Run the project

- **MAC / LINUX:**

```
./gradlew run
```

- **WINDOWS:**

```
gradlew.bat run
```

- The very first run will take a few minutes — it's downloading all the supporting libraries it needs. This is normal; just let it finish.
- This launches a development copy of RuneLite with the Drop Market plugin already installed and enabled.

> **First-time login:** the dev client will ask you to log in through the Jagex launcher, just like regular RuneLite.

> **If login credentials won't save:** you may need to add `--insecure-write-credentials` as a "Client argument" in the Jagex launcher's settings for this specific build. Only use this for your own local development setup — never share this flag or your credentials publicly.

4 Running it again later

- Open your terminal and go back into the project folder:

```
cd Desktop/drop-market
```

- Get the newest version of the code (if it changed on GitHub):

```
git pull
```

- Run it the same way as before:

```
./gradlew run
```

(WINDOWS: `GRADLEW.BAT RUN`)

5 If something breaks

- Run the automated checks first — the error output usually points directly at the problem:

```
./gradlew clean test
```

- Common causes: the wrong Java version is installed, or there's no internet connection for the first-time download of dependencies.
